TASK: 1

Draw a simple diagram (hand-drawn or digital) showing how your phone connects to Instagram, including your device, WiFi router, ISP, and Instagram server. Label each part and the connections.

Explanation: My smartphone connects to the Wi-Fi router through a wireless connection. The router connects to the Internet through the ISP (Internet Service Provider). The Internet carries requests from my phone to the Instagram server. The server processes the request and sends data, such as posts, reels, and messages, back to my phone.

NETWORK

TASK: 2

List 5 devices you use or see daily that are part of a network (for example: smartphone, smart TV, WiFi router, laptop, smartwatch). For each, write what type of network it connects to (LAN, WAN, PAN, etc.).

No.	Device	Type of Network	Purpose
1	Smartphone	WAN / WLAN	Connects to the Internet through mobile data or Wi-Fi.
2	Laptop	LAN / WLAN	Connects to the Internet through Wi-Fi or Ethernet.
3	Smart TV	WLAN / LAN	Connects to the Internet to stream movies and videos.
4	Smartwatch	PAN	Connects to a smartphone using Bluetooth.
5	Wi-Fi Router	LAN	Connects multiple devices within a local network and provides Internet access.

Conclusion: These devices use different types of networks to communicate, share information, and access the Internet.

NETWORK

TASK: 3

Explain the difference between the Internet and an intranet using an example from your college or a public WiFi you have used.

The **Internet** is a worldwide public network that allows people to access websites, applications, and information from anywhere. For example, I can use my smartphone to access Instagram or YouTube through my college's public Wi-Fi.

An **intranet** is a private network used by an organization, such as a college, to share information with authorized users. For example, my college may have an internal student portal where students can access attendance records, notices, or academic information using their college accounts.

Internet	Intranet
It is a public global network.	It is a private organizational network.
Anyone can access publicly available services with an Internet connection.	Only authorized users can access its restricted resources.
Example: Instagram, Google, and YouTube.	Example: A college's private student information system.
It connects networks worldwide.	It connects users and resources within an organization.

Conclusion: The Internet is used for worldwide communication, while an intranet is used for private communication and information sharing within an organization.

NETWORK

TASK: 4

**Pick any one app you use (like WhatsApp, Zomato, or Flipkart) and describe, in 4-5 lines, how data travels from your device to their server and back when you perform a search inside the app.

Hint: Mention the devices and networks involved, and what happens when you hit 'search'.**

How Data Travels When I Search on Flipkart

When I open the Flipkart app on my smartphone and search for a product, my phone sends the search request through Wi-Fi to the router or through mobile data to the Internet.
The request travels through my ISP and the Internet to the Flipkart server.
The server processes the search request and finds products matching the entered keywords.
The server sends the product details, images, and prices back through the Internet to my smartphone.
Finally, the Flipkart app displays the search results on my screen.

Conclusion: This process allows my smartphone and the Flipkart server to communicate and exchange data through a network.
